Sanitary applications
About us

As a family-run business acting globally, with over 10,000 highly qualified employees, the WIKA group of companies is a worldwide leader in pressure and temperature measurement. The company also sets the standard in the measurement of level, force and flow, and in calibration technology.

Founded in 1946, WIKA is today a strong and reliable partner for all the requirements of industrial measurement technology, thanks to a broad portfolio of high-precision instruments and comprehensive services.

With manufacturing locations around the globe, WIKA ensures flexibility and the highest delivery performance. Every year, over 50 million quality products, both standard and customer-specific solutions, are delivered in batches of 1 to over 10,000 units.

With numerous wholly owned subsidiaries and partners, WIKA competently and reliably supports its customers worldwide. Our experienced engineers and sales experts are your competent and dependable contacts locally.
In the manufacture of food and pharmaceuticals, safety in production and the prevention of any risks to those using the finished product is of the highest priority.

In the chain of all the process components within a plant, measurement technology plays a key role. Measurement technology delivers process-specific information which enables high-quality production. For this, the safety and hygienic requirements in the design of the measuring instruments and the connection of the sensors to the production plant must be fulfilled optimally with respect to ease of cleaning.

This brochure will assist you in selecting hygienic measuring instruments to solve pressure, temperature and level measurement challenges. In co-operation with you, we will develop tailored solutions geared to the individual requirements of your process.
Hygienic design

The hygienic design of plant components in contact with products is an essential prerequisite for avoiding microbiological contamination, and with that, ensuring product quality. As part of the overall hygienic concept of a plant, the measuring instruments used must comply with special requirements on material, surface quality, process safety, connection engineering and cleanability in the scope of the CIP process.

As a company member of the European Hygienic Engineering and Design Group (EHEDG), WIKA contributes to the international standards and combines hygienic design with high-quality measurement technology.

Materials

Austenitic stainless steel is used as a standard material for wetted areas. In the food and beverage industry and also in the pharmaceutical industry, 1.4404 and 1.4435 grades are preferred.

Stainless steels are inert to the majority of foods and pharmaceuticals, while also offering good corrosion resistance to disinfectants and cleaning agents. In this respect, 1.4435 displays a better corrosion resistance than 1.4404. For specific applications, special alloys are used, such as the fully austenitic stainless steel, 1.4539 (904L), or Hastelloy C and Inconel, and also plastic coatings such as PFA (perfluoroalkoxy) or PTFE (poly-tetra-fluoro-ethylene). With diaphragm measuring instruments, we use the highly corrosion-resistant nickel chrome alloy, 2.4668 (N07718), in order to achieve an optimal measurement performance with higher robustness.

As a standard material for all those metallic surfaces that will come into contact with the process medium, we use stainless steel 1.4435.

Surfaces

An important aspect in the cleaning of a plant using CIP/SIP processes is the quality of the surfaces in contact with the process medium.

To enable the easy cleaning of the measuring instruments, and also to prevent biofilms, the wetted surfaces must be passive and free from microscopic flaws. In addition to the surface topography, the surface roughness is an important criterion for cleanability. In the standards, such as EHEDG Doc. No. 8, “Hygienic equipment design criteria”, a roughness of Ra < 0.8 μm is considered as sufficient for normal cleaning processes.

For sensitive biotechnology processes, surfaces with a lower roughness are needed, e.g. Ra < 0.38 μm per ASME BPE.
Electropolishing

By using electrolytic polishing, the cleanability of the surfaces can be improved. In this way, essentially, the topographical structure of the surfaces is smoothed and therefore the roughness is decreased. A further advantage is that electropolishing increases the passive layer of stainless steel, and thus the corrosion resistance is improved, especially with reducing media.
Sealing materials

In the selection of suitable sealing material, various process parameters and also the process media are important. Sealing materials must be toxicologically harmless and sufficiently resistant to abrasion, be resistant against aggressive cleaning and disinfecting media, and be stable in superheated steam at high sterilisation temperatures.

Predominantly, special compounds are used for O-rings or form seals, for example fluororubber-based (FKM) such as VITON®, ethylene-propylene-diene material (EPDM) or poly-tetra-fluoro-ethylene (PTFE). The materials used for the sealing elements, and also their manufacturing processes, must conform to the rules of the regulatory authorities and organisations.
Process connections

Process connections which are used in CIP-capable equipment should not constitute any risk in respect to cleaning. They are characterised by the following features:

- A defined compression of the sealing element through a metallic stop
- Centring via a cylindrical guide
- Crevice-free sealing on the inside of the pipe

For this, there are connections such as those in accordance with DIN 11864, NEUMO BioConnect®, BioControl® and VARIVENT®.

The widely used connections in accordance with DIN 11851 (milk thread fitting) and DIN 32676 (clamp) were originally developed to disassemble plant components easily. They are therefore ideally suited to equipment that needs to be removed for cleaning. If measuring instruments with these process connections are operated with CIP cleaning, the appropriate profile sealing has to be used.

Process connections with metallic sealing components (thread with sealing cone) form a gap at the sealing point and must therefore be assessed very critically with regard to their cleanability, especially with repeated sealing and fitting following the calibration of the measuring instruments.
Case

The design of the non-wetted parts must be made so that the equipment is easy to clean from the outside as well. Particularly with open processes in food production, the machinery and equipment must be cleaned after production. For this, WIKA has developed specific hygienically designed cases. These are easy to clean from the outside. Without any gaps or corners and with a high IP protection, these are especially suited to the harsh conditions of washdowns.
Directives and standards

WIKA combines hygienic design with high-quality measurement technology. We actively participate in international standards committees such as EHEDG, 3-A and ASME BPE. The latest market requirements flow into our product development.

Connection to the process with diaphragm seals

The connection of pressure measuring instruments to the process is ideally performed by means of diaphragm seals with hygienic connections.

Diaphragm seals

Diaphragm seals separate the pressure measuring instrument, pressure sensor or pressure switch from the medium and ensure a process connection which is either free of dead spaces or where dead spaces are reduced to a minimum. The isolation is achieved by means of a flexible metal diaphragm. The internal space between the diaphragm and the pressure measuring instrument is completely filled with a fluid. The process pressure is transmitted by the elastic diaphragm into the fluid and from there to the measuring instrument.

Advantages of diaphragm seals

In contrast to ceramic principles, with diaphragm seals - as a result of the measuring cell’s metallic construction - additional sealing elements are eliminated, and so the maintenance burden is significantly reduced. Ceramic measuring cells exhibit a high sensitivity to dynamic loads. With any sudden pressure spikes, the ceramic cell can be destroyed. In these cases, combinations of measuring instruments and diaphragm seals are clearly preferable.
Possibilities for combination and assembly

The combination of mechanical or electronic pressure measuring instruments with flush diaphragm seals meets the stringent demands made on hygienic instrumentation and is suitable for even the most difficult measuring requirements. Mounting of the diaphragm seal to the measuring instrument may be made via a direct connection, for high temperatures via a cooling element or via a flexible capillary.

System fill fluids for diaphragm seal systems

The media used by us are FDA conform.

Neobee® is a registered trademark of the Stepan Company.
Further system fill fluids can be used for special applications after technical application support.
Diaphragm seals

Diaphragm seals are mounted to existing fittings. Usually the fittings consist of T-pieces which are integrated into a pipeline, or of welding sockets which are welded to a pipeline, the process reactor or a tank.

Diaphragm seals offer the advantage that the “contact surface” between pressure medium and diaphragm is relatively large, thus ensuring accurate pressure measurement. Furthermore, they can be easily removed for cleaning or calibration.

These diaphragm seal systems have been developed for hygienic applications in the pharmaceutical industry and for food and beverage production. They are suitable for quick, residue-free cleaning, in particular for cleaning in place (CIP) and sterilisation in place (SIP).

The clamp connections are fast and easy to open for cleaning or seal replacement.

In-line diaphragm seal

The in-line diaphragm seal is perfectly suited for use with flowing media. With the seal being completely integrated into the process line, measurements do not cause any turbulences, corners, dead spaces or other obstructions in the flow direction.

The measured medium flows, without obstruction, through the in-line diaphragm seal. This effects an additional self-cleaning of the measuring chamber. The in-line diaphragm seal is installed directly into the pipeline.
Precision digital pressure gauge with diaphragm seal

When assembled with the model 990.22 diaphragm seal, the CPG1500 is optimally suited for processes in the food and pharmaceutical industries. The large display enables the measured values to be read easily and precisely. The instrument can also be used for leakage monitoring on sterile vessels, in particular for vessels with low pressure blankets. With the help of the data logging function, the measured values can be recorded over a long period of time.

Data sheet CT 10.51

Pressure measuring instruments for homogenisers

Pressure measuring instruments with model 990.30 diaphragm seals have been specifically developed for homogenising processes, where there are extremely dynamic pressure loads.

Complex structural features allow pressures of up to 2,500 bar and ensure a long service life. The model is available as a purely mechanical solution or with a 4 ... 20 mA output signal.

Further information on model 990.30 can be found in data sheet DS 99.33.
WIKA’s patented (patent no. DE19949831) double diaphragm offers a solution for critical processes where the product must not find its way into the environment, or where the fill fluid in the diaphragm seal assembly must not find its way into the product.

The space between the two diaphragms is evacuated.

The emerging vacuum is monitored by means of a measuring instrument, for example a pressure switch. Should a diaphragm rupture, there will be an optical, acoustic or electrical warning. The damaged system can be exchanged. Further information on model DMS-FP can be found in data sheet DS 95.20.

Electronic pressure measurement contributes to the precise and energy-saving control and regulation of processes. Alongside temperature, pressure is the most important and most common technology for monitoring and controlling plants and machinery.

With pressure measuring instruments, alongside the monitoring of process pressure and hydrostatic level measurement, a full range of process steps can be controlled, such as the dosing of inert gas blankets, the monitoring of filters in downstream areas and filling pressures. For the various applications there are a number of pressure sensors available.

Pressure sensors

The flush metal measuring cell of the SA-11 is directly welded to the process connection and fulfils the high demands of sanitary applications. With the gap-free connection without additional sealing between the process connection and the measuring cell, risks of leakage are eliminated. For dead-space free instrumentation, numerous hygienic process connections are available. This is certified per 3-A Sanitary Standards as well as EHEDG. The SA-11 pressure transmitter is exceptionally suitable for both the cleaning processes Cleaning-in-Place (CIP) and also for Sterilisation-in-Place (SIP) with elevated temperatures.

### PSA-31
**Pressure switch with display**

The PSA-31 electronic pressure switch is recommended, among other things, for applications in filling and packaging machinery for the food and pharmaceutical industries. The 3-key operation makes simple, intuitive menu navigation possible, with no need for additional assistance, for setting the two switch points. The instrument is extremely robust and the wetted parts are particularly easy to clean. With its case that can be turned through 300 degrees, this electronic pressure switch can be easily adjusted to any individual installation situation. The large, angled display, which is also rotatable, is easy to read from any position.

Process pressure transmitters

Through its robust stainless steel case in hygienic design, the UPT-21 process transmitter is suitable for almost all applications. Via the display and operating module or via the HART® interface, it is scalable from 0 … 400 mbar up to 0 … 600 bar with the 4 … 20 mA output signal.

The process connections are available in all popular connection geometries. Through the hygienic case, no unwanted germs can accumulate on the instrument’s surfaces. The robust design also permits cleaning with high-pressure equipment. Particularly for the measurement in tanks, the integrated firmware offers the possibility to display the filling volume directly.

The IPT-21 process pressure transmitter, with its 4 … 20 mA/HART®, PROFIBUS® PA or FOUNDATION™ Fieldbus output signal, combined with the intrinsically safe or flameproof enclosure ignition protection type (in accordance with ATEX or FM), is ideally suited for application in appropriate systems. The instruments can be used for standard pressure measurement and also for hydrostatic level measurement. The programming of the tank linearisation can be made graphically and very simply with the assistance of the DTM (Device Type Manager).

Easy configuration and operation

The operation and configuration at the instrument can be made, optionally, on a display and operating module via 4 membrane keys. The operating menu has a simple and self-explanatory structure and has 9 selectable languages as standard.

Special features

- High measurement accuracy
- Best long-term stability
- Freely scalable measuring ranges (turndown to 30 : 1)
- Configuration via DTM (Device Type Manager) in accordance with the FDT (Field Device Tool) concept (e.g. PACTware) and primary standards
Pressure gauges

For a reliable on-site display of the operating pressure, a wide range of mechanical pressure measuring instruments is available. Our product line ranges from proven Bourdon tube instruments, through diaphragm element and capsule gauges to robust pressure gauges for the measurement of over-, absolute and differential pressure. The measuring instruments are characterised, in particular, by mechanics made completely from stainless steel.

Limit indicator

The limit indicator, which is available as an option, finds its application wherever overpressures must be displayed with certainty and not be tampered with.

The limit indicator is a mechanical indicator mounted on the dial with two settings:

If the indicator is in the green area, the pressure limit being monitored has not been exceeded.
If the indicator is found in the red area, the set pressure range has been exceeded at least once. In this case, the indicator will remain permanently locked and protected from tampering in the red area.

Pressure gauges with electrical output signal or switch contacts

Wherever the process pressure has to be indicated locally and, at the same time, a signal transmission to the central control or remote centre is desired, the model PGT23 intelliGAUGE® can be used.

Through the combination of a mechanical measuring system and electronic signal processing, the process pressure can be read securely, even if the voltage supply is lost.

Our offer is completed by the pressure gauges with switch contacts, e.g. switchGAUGE model PGS23, making it possible to simultaneously monitor the equipment and to switch circuits.

The following measuring instruments are particularly recommended for use in sanitary applications and for combination with diaphragm seals for a hygienic adaption to the process.

Diaphragm pressure gauges

No risk of contamination by system fill fluid

The diaphragm measuring instruments operate without any system fill fluid. These transmit the pressure from the process to the easily readable pressure indication purely mechanically. By eliminating any liquids, the “dry measuring cell” increases the process safety for sterile pressure measurement.

Robust diaphragm element with high overload safety

Proven over decades, diaphragm elements can also withstand pressure spikes and overloads thanks to their strong diaphragms. Through this, the danger of damage to the flush diaphragm is clearly reduced.

Hygienic design

The measuring instruments have been developed for the pressure display during the processing and transport of high-value and critical media. This means that they can be cleaned easily and quickly during batch changes and are ideally suited for CIP, SIP and washdown processes.

Autoclavability

The instruments can be completely autoclaved. This means that they can be steam-sterilized together with the sterile container in an autoclave. Thus, the measuring instruments can be installed just before the sterilization in order to save time and effort in preparation.

The video for this instrument family can be found here:
PG43SA-S
Pressure measuring instrument with flush diaphragm element

Nominal size: 100 mm
Scale range:
-1 ... 0.6 to -1 ... 15 bar
0 ... 1.6 to 0 ... 16 bar
Accuracy class: 1.6
Overload safety: 2 ... 5 x full scale value, max. pressure rating of the process connection
Special feature: Completely autoclavable (optional)
Data sheet: PM 04.16

PG43SA-C
Compact pressure measuring instrument with flush diaphragm element

Nominal size: 63 mm
Scale range:
-1 ... 2 to -1 ... 9 bar
0 ... 3 to 0 ... 10 bar
Accuracy class: 2.5
Overload safety: 5 x full scale value, max. pressure rating of the process connection
Special feature: Back mount version
Data sheet: PM 04.15

For the highest safety aspects

PG43SA-D
Pressure measuring instrument with integrated diaphragm element monitoring

Application: For the production of active pharmaceutical ingredients (API)
Nominal size: 100 mm
Scale range:
-1 ... 1.5 to -1 ... 15 bar
0 ... 2.5 to 0 ... 16 bar
Accuracy class: 1.6
Overload safety: 1.5 ... 4 x full scale value, max. pressure rating of the process connection
Special feature:
- Fully autoclavable
- Optional sterilisation of the reference chamber per ISO 20857/2010
Data sheet: PM 04.17

Diaphragm element monitoring
The model PG43SA-D is fitted with a patented system for diaphragm element monitoring (e.g. patent DE102015006524). The risk of an undetected diaphragm element rupture is eliminated. In the event that the diaphragm element is damaged, either through improper handling or through extreme process conditions, this can lead to a crack. This is immediately indicated on the dial by a red warning point. If this point on the dial remains white, then the pressure element is intact and cost-intensive maintenance is not required.

Second barrier
For double safety, the measuring instrument has an integrated secondary barrier which, in the event of a diaphragm element break maintains the hermetic sealing of the process. This prevents the escape of hazardous substances from the process to the environment and vice versa - excluding contamination of the process media with particles from the environment. This increases the operational and process safety in a pharmaceutical plant. Optionally, this space between the diaphragm element and the secondary barrier can be sterilised with dry heat.

White dot: Diaphragm element intact

Red dot: Diaphragm element defective

Electrical temperature measurement

Resistance thermometers are equipped with metallic-conductor based sensor elements which change their electrical resistance as a function of temperature. The connection to the evaluation electronics (transmitter, controller, display, chart recorder, etc.) can be made with a 2-, 3- or 4-wire circuit, depending on the application. In the food and beverage industry, as well as in pharmaceuticals, biotechnology and cosmetics manufacturing, the focus is on more than just providing temperature readings.

The instruments for electrical temperature measurement are characterised by the following features:

**Individuality**
Through tailored thermometer designs corresponding to your process and the available space

**Flexibility**
Through different thermowells, sensors and signal processing possibilities

**Modularity**
Through detachable thermometer-thermowell connections and standardised measuring inserts for simplified storage
Electrical temperature measuring instruments

Speed
Through spring-loaded measuring inserts for defined fitting conditions in the thermowell and optimised response times

Reliability and high plant availability
Through a high IP protection of up to IP69K for particularly harsh environmental conditions during a washdown. Through easy and quick cleanability with dead-space free and patented measuring instruments, 3-A and also EHEDG certified

Compact and safe
Through space-saving cases, for hazardous areas
Electrical temperature measuring instruments

For temperature measurement in the widest range of applications, WIKA offers a comprehensive product programme of electrical thermometers. The TR21 series is characterised by a compact design and fast electrical connection. The series cases are available with IP68 and IP69K protection. In the TR22 series WIKA’s proven temperature transmitters are used, with which all standard output signals are available.

Easy calibration or maintenance, without having to open the process, is possible in both series with connection to the process via thermowell. In this way, hygiene risks can be minimised and downtimes can be reduced. Suitability for use in sanitary applications is confirmed by the successful 3-A auditing and EHEDG certification.

**TR21-A**
- **Miniature design with flange connection**
- **Sensor element**: Pt100, Pt1000
- **Measuring range**: -30 ... +250 °C
- **Output**: Pt100, Pt1000, 4 ... 20 mA
- **Connection to thermowell**: Removable G ⅜"
- **Ingress protection**: IP69K autoclavable
- **Data sheet**: TE 60.26

**TR21-B**
- **Miniature design for orbital welding**
- **Application**: Invasive temperature measurement in the product stream
- **Sensor element**: Pt100, Pt1000
- **Measuring range**: -30 ... +150 °C
- **Output**: Pt100, Pt1000, 4 ... 20 mA
- **Connection to thermowell**: Removable G ⅜"
- **Ingress protection**: IP69K autoclavable
- **Data sheet**: TE 60.27

**TR21-C**
- **Miniature design with welded flange connection**
- **Sensor element**: Pt100, Pt1000
- **Measuring range**: -30 ... +250 °C
- **Output**: Pt100, Pt1000, 4 ... 20 mA
- **Connection to thermowell**: Welded
- **Ingress protection**: IP69K autoclavable
- **Data sheet**: TE 60.28
**TR20**

**Flush**

- **Application**: For flush vessel mounting when using wipers
- **Sensor element**: Pt100
- **Measuring range**: -50 ... +250 °C
- **Output**: Pt100, 4 ... 20 mA
- **Connection method**: 2-, 3- and 4-wire
- **Data sheet**: TE 60.20

---

**TR22-A**

**With flange connection**

- **Sensor element**: Pt100
- **Measuring range**: -50 ... +250 °C
- **Output**: Pt100, 4 ... 20 mA
- **Connection to thermowell**: Removable M24
- **Data sheet**: TE 60.22

---

**TR22-B**

**For orbital welding**

- **Application**: Invasive temperature measurement in the product stream
- **Sensor element**: Pt100
- **Measuring range**: -50 ... +150 °C
- **Output**: Pt100, 4 ... 20 mA
- **Connection to thermowell**: Removable M24
- **Data sheet**: TE 60.23

---

**TR25**

**In-line resistance thermometer**

- **Application**: For piggable systems and powdery media
- **Sensor element**: Pt100
- **Measuring range**: -50 ... +150 °C
- **Output**: Pt100, 4 ... 20 mA
- **Pin assignment**: 3- or 4-wire
- **Data sheet**: TE 60.25

---

**TR57-M**

**Pipe surface resistance thermometer for clamping**

- **Sensor element**: 1 x Pt100
- **Measuring range**: -20 ... +150 °C
- **Output**: Pt100, 4 ... 20 mA
- **Data sheet**: TE 60.57
Temperature transmitters

Transmitters convert the temperature-dependent change in resistance of resistance thermometers or the temperature-dependent voltage change in a thermocouple into a proportional standard signal. The most commonly used standard signal is the analogue 4 … 20 mA signal, though digital signals (fieldbus) are gaining more and more importance.

By using intelligent circuit concepts with analogue 4 … 20 mA signals, any sensor errors that occur are signalled and simultaneously transmitted with the measured value over a two-wire line (current loop). The conversion and transmission of the standard signals (analogue or digital) is made over long distances and completely fail-safe. A temperature transmitter can either be mounted directly at the measuring point in the connection head or on a DIN rail in a control cabinet.

Interoperability:

Internal and external tests certify the compatibility of our transmitters with almost all open software and hardware tools.

Dial thermometers

For temperature measurement with dial thermometers, WIKA manufactures bimetal and gas-actuated thermometers.

Due to their simple design, bimetal thermometers are suitable for displaying temperature reliably, even under difficult conditions such as shocks or vibrations.

If, however, fast temperature measurement is required or if long distances have to be bridged without power supply, gas-actuated thermometers are recommended.

Based on these measurement methods, there is a comprehensive range of instruments.

For hygienic applications in areas such as the food, beverage, pharmaceutical, cosmetics manufacturing and biotechnology industries, some examples of mechanical temperature measuring instruments with stainless steel cases are listed below.

Gravimetric level measurement refers to the control of levels through measuring the weight of vessels and the contents within them. From the measured data, the filling height is calculated. Gravimetric level measurement is in demand in temperature-critical applications and where robustness and high durability are required. High-accuracy weight detection without any material contact is possible with this method.

Typical areas of application include gravimetric level monitoring of vessels and silos as well as weighing in process plants and dosing systems.

This method of measurement offers the following advantages:

- The operator can simultaneously determine the level and the exact mass
- No intrusion into the tank or vessel is needed
- High-accuracy weight determination without any contact with the media
- The measurement is independent of the material, its properties and the vessel geometry
- Simple replacement of the bending or shear beams
- Verifiable measurement is possible
- As suitable for small vessels as it is for large silos up to 40 t
- Long-term stability
- Low maintenance effort

Gravimetric level measurement

Shear beam or bending beam with mounting kit

Accessories

Matching mounting kits, weighing modules, terminal boxes (summation units) and evaluation electronics as well as large displays are available and allow easy and safe installation in the application.

E1930 large display
E1932 strain gauge weighing electronics

Continuous level measurement

The float-based level measurement is not influenced by moving surfaces, electrical conductivity, dielectric constants, foaming and boiling surfaces.

When selecting the correct measurement principle for sanitary applications, e.g. use in fermenters, various criteria need to be considered with which float-based measurement technology brings advantages. Generally, in the process of fermentation, agitators and their movement cause foaming on the surface of the medium, where the foam can be fine-pored or coarse-pored, depending on the process.

Reed chain

For continuous level and interface measurement, depending on the application and measuring length, different sensor systems are available. The quasi-continuous system is based on a resistance measuring chain with reed contacts as 3-wire potentiometer circuits. With contact pitches from 5 to 20 mm – depending on the measuring length – a measurement accuracy of 1 % in 500 mm can be achieved.

Magnetostriction

For high-accuracy measuring requirements, sensors which operate on the magnetostrictive measurement principle are available. They achieve an accuracy of 0.1 mm. These level sensors are used as measured value pick-ups for the continuous detection of liquid levels, and are based on determining the position of a magnetic float according to the magnetostrictive principle.
For the point-based monitoring of levels, float switches are available, which are generally fitted at the top of the tank. It makes no difference whether only one or several level limits are monitored. Within the guide tube, the inert gas contacts (reed contacts) set to the pre-defined switching positions are activated magnetically and without contact. Depending on requirements, it is possible to define a minimum/maximum alarm value and also an emergency shut-down level. The float switches are simple to mount and maintenance-free.

**Switching function**
Normally open (closed in medium) or normally closed (open in medium)

**Operating pressure**
0 ... 2.5 MPa (0 ... 25 bar)

**Ingress protection**
IP65 with connector
IP69K with protection cap

**Special feature**
Autoclavable to 134 °C

**Data sheet**
LM 31.05

The OLS-F1 optoelectronic level switch is suitable for a variety of applications and can be installed in all positions. Thanks to its compact design, it is also suitable for small pipe cross-sections and installation situations in tightly limited spaces.

Principles of level measurement
Digital indicators and temperature controllers

With digital indicators, the measured values from electrical temperature probes or from pressure and temperature transmitters are shown on a display. Integrated alarm outputs enable, in addition, the control of the measured process values. Even simple two-position control, such as level control, is possible with the switching outputs from the digital indicators.

Temperature controllers are used to control the temperature in production processes or for the temperature regulation of raw materials and finished products in storage and transport vessels. With the help of switchable set points, different set points can be easily selected. Via optional serial interfaces, controllers can be connected to a network and connected to a higher-level control room.

Within the refrigeration cycle and its periphery there are many points where pressure and temperature are measured and monitored. This serves to control the plant in order to guarantee a secure process run.

In addition to the multitude of applications, the size of the refrigeration system, the refrigerant, etc. place particular demands on the measuring instruments. Here, WIKA is the competent partner for measuring instruments for pressure, temperature and calibration in all parts of refrigeration plants.

Ventilation and air-conditioning

With air2guide, WIKA offers a comprehensive range of measuring instruments for ventilation and air-conditioning applications.

The measuring instruments are used for differential pressure monitoring on filters, monitoring of ventilators and blowers, overpressure monitoring for clean rooms, temperature monitoring on heat exchangers, measuring of the air flow and the air velocity in air ducts and air-conditioning systems, and also for the control of air and fire shutters.

Refrigeration and air-conditioning technology

Within the refrigeration cycle and its periphery there are many points where pressure and temperature are measured and monitored. This serves to control the plant in order to guarantee a secure process run.

In addition to the multitude of applications, the size of the refrigeration system, the refrigerant, etc. place particular demands on the measuring instruments. Here, WIKA is the competent partner for measuring instruments for pressure, temperature and calibration in all parts of refrigeration plants.
Installation examples

Process connection of the BioControl® system

The pharmaceutical BioControl® system is used to connect pressure and temperature measuring instruments to piping systems and vessels. For the different types of problems encountered in sanitary applications, there are various designs of the BioControl® system with component approvals available.

An advantage to the user is that the system is highly flexible. In the design of the plant, it makes no difference whether the port is fitted with a pressure or a temperature measuring instrument. Design errors can be avoided due to the modular system with standardised interfaces. Furthermore, storage costs are reduced to a minimum since only a few components need to be kept in stock.

Process connection of the VARINLINE® system

To connect the pressure and temperature measuring instruments to the aseptic processes, aseptic fittings are required. For this, VARIVENT® connections are available to the process engineer in the production of food, which ensure a dead-space free transition from the process line to the measuring instrument. WIKA pressure and temperature measuring instruments with VARIVENT® connections fit smoothly into the VARINLINE® access units.

BioControl® is a registered trademark of NEUMO. VARIVENT® and VARINLINE® are registered trademarks of the company GEA Tuchenhagen.
Clamp model 990.22 with sterile extension

WIKA has developed a diaphragm seal system with a process connection that is specifically suited to pressure measurement in sanitary applications. The EHEDG (European Hygienic Engineering & Design Group) has tested the model 990.22 clamp with sterile extension and has certified it as having exceptional suitability for sanitary applications.

The model 990.22 clamp with sterile extension is easy to handle when installing and removing. With the help of a special welding socket, a flush sealing to vessels and pipelines is ensured. Thus it offers the user an easy-to-clean pressure measuring point, which is suitable for CIP and SIP.

Weld-on adapter for flush pressure transmitters

In open vessels or vented tanks, the operator measures the level hydrostatically with a pressure transmitter. For this, one installs the measuring instrument in the bottom or close to the bottom. This measurement can be used on practically all liquids whose density remains constant. The measurement is not affected by pastes, emulsions or blends of solid ingredients. Also, hydrostatic level measurement is not affected by foaming on the liquid surface.

To mount the measuring instrument, a socket is welded into the vessel wall and the inside smoothed. This enables a flush and easy-to-clean measuring point for pressure measurement in a vessel.
Process adapter system

The WIKA process adapter system has been developed to meet the requirements of the food, beverage and pharmaceutical industries. The adapter system consists of a pressure measuring instrument or transmitter with a built-in process adapter.

The flexible, modular system allows connection to a wide range of aseptic process connections (e.g. clamp, threaded, VARIVENT® or NEUMO®). All parts are made of 316L/1.4435 stainless steel. The O-ring for sealing the process (optional) is supplied with a 3.1 material certificate per EN 10204. It is available in either EPDM or FKM and is listed as FDA, USP class VI, as well as 3-A 18-03.

The WIKA adapter system meets the high requirements of sterile processes and has been developed in accordance with the 3-A Sanitary Standards.

Thermowell for orbital welding

Flow-through housing
The model TW61 thermowell serves as the process connection for a model TR21-B or TR22-B resistance thermometer. The thermowell is especially suitable for the adaption of temperature measurement into pipelines for sanitary applications and for CIP and SIP processes. The ease of cleaning is ensured through the optimal hygienic design. To integrate it into the process, the thermowell is directly orbitally welded into a pipeline. The connection ends are smooth and prepared for orbital welding.

The measuring insert can be withdrawn together with the connection head. This makes it possible to calibrate the thermometer with the entire measuring chain, on-site, without disconnecting the electrical connections. In addition, this avoids having to open the process, and thus the risk of contamination is minimised.

Angular housing
For small nominal pipe sizes and in cramped conditions, angular housing thermowells are available. The thermowell is dead-space optimised and is welded automatically, thus it is preferable to thermowells with welding balls and hand-welded seams. The measuring instruments should be aligned horizontally in order to avoid air pockets in the cupola.
Calibration technology

From individual components ...

**Portable pressure generation**
Test pumps serve as pressure generators for the testing of mechanical and electronic pressure measuring instruments through comparative measurements. These pressure tests may be carried out in the laboratory, workshop, or on site at the measuring point.

**Measuring components**
High-accuracy pressure sensors and very stable standard thermometers are ideal for applications as references in industrial laboratories. Due to their analogue or digital interfaces, they can be connected to existing evaluation instruments.

**Hand-holds, calibrators**
Our hand-held measuring instruments (process tools) offer a simple capability for measurement or simulation of all established measurands on site. They can be operated with a wide variety of pressure sensors or thermometers.

... to a fully automated system

**Digitally indicating precision measuring instruments**
High-accuracy digital precision measuring instruments are ideal for applications as reference standards in industrial laboratories or metrology, enabling high-accuracy calibration. They feature exceptionally simple handling and an extensive range of functionality.

**Digital precision instruments and controllers**
Due to their integrated controller, these instruments offer exceptional convenience. Typically, a fully automated setting of the required value can be done via the interface.

**Fully automated calibration systems as complete solutions**
Fully automated calibration systems are customer-specific, turnkey installations which can be fitted in laboratories as well as in the production environment. With integrated reference instruments and calibration software, calibration certificates can be generated and archived in a simple and reproducible way.
Calibration services

Our calibration laboratories have been calibrated for pressure and temperature for over 30 years. Since 2014, our calibration laboratory has also been accredited for the electrical measurands DC current, DC voltage and DC resistance.

We have expanded our factory calibration portfolio to force and length measuring instruments.

Manufacturer-independent calibration - fast and precise for ...

-1 bar … +10,000 bar
Calibration using working standards (precise electrical pressure measuring instruments) or high-accuracy reference standards (pressure balances)
With an accuracy of 0.003 % … 0.01 % of reading
In accordance with the directives DIN EN 837, DAkkS-DKD-R 6-1 or EURAMET cg-3

-196 … +1,200 °C (to +1,600 °C possible with factory calibration)
Comparative calibration in calibration baths and tube furnaces with an accuracy of down to 1.5 mK
Calibration at fixed points of ITS90 with the smallest possible measurement uncertainties
- Triple point of mercury (-38.8344 °C)
- Triple point of water (0.01 °C)
- Melting point of gallium (29.7646 °C)
- Solidification point of zinc (419.527 °C)
- Solidification point of aluminium (660.323 °C)
In accordance with the appropriate DKD/DAkkS directives

Current, voltage, resistance

- DC current from 0 mA ... 100 mA
- DC voltage from 0 V ... 100 V
- DC resistance from 0 Ω … 10 kΩ
In accordance with the directives VDI/VDE/DGQ/DKD 2622

On site (pressure and temperature)

In order to have the least possible impact on the production process, we offer you a time-saving, on-site DAkkS calibration throughout Germany.

- In our calibration van or on your workbench
- With a DAkkS accreditation for pressure
  - from -1 bar … +8,000 bar
  - with accuracies between 0.025 % and 0.1 % of full scale for the standard used
- With a DAkkS accreditation for temperature from -55 °C … +1,100 °C

ISO 9001 certified
DKD/DAkkS accredited
(in accordance with DIN EN ISO/IEC 17025)
Cooperation in the DKD/DAkkS working groups
Over 60 years of experience in pressure and temperature measurement
Highly qualified, individually trained personnel
Latest reference instruments with the highest accuracy

-1 bar … +10,000 bar
Calibration using working standards (precise electrical pressure measuring instruments) or high-accuracy reference standards (pressure balances)
With an accuracy of 0.003 % … 0.01 % of reading
In accordance with the directives DIN EN 837, DAkkS-DKD-R 6-1 or EURAMET cg-3

-196 … +1,200 °C (to +1,600 °C possible with factory calibration)
Comparative calibration in calibration baths and tube furnaces with an accuracy of down to 1.5 mK
Calibration at fixed points of ITS90 with the smallest possible measurement uncertainties
- Triple point of mercury (-38.8344 °C)
- Triple point of water (0.01 °C)
- Melting point of gallium (29.7646 °C)
- Solidification point of zinc (419.527 °C)
- Solidification point of aluminium (660.323 °C)
In accordance with the appropriate DKD/DAkkS directives

Current, voltage, resistance

- DC current from 0 mA ... 100 mA
- DC voltage from 0 V ... 100 V
- DC resistance from 0 Ω … 10 kΩ
In accordance with the directives VDI/VDE/DGQ/DKD 2622

On site (pressure and temperature)

In order to have the least possible impact on the production process, we offer you a time-saving, on-site DAkkS calibration throughout Germany.

- In our calibration van or on your workbench
- With a DAkkS accreditation for pressure
  - from -1 bar … +8,000 bar
  - with accuracies between 0.025 % and 0.1 % of full scale for the standard used
- With a DAkkS accreditation for temperature from -55 °C … +1,100 °C
